**Building Application Servers (SIGS: Advances in Object Technology)** Rick Leander
To address new demands in business computing, software vendors are introducing application server
toolkits. The concept is to create clusters of low-cost computers that support one specific business area, then
connect these clusters to the corporate network. By using the network as the computer, one piece of software
can support desktop computing, electronic commerce, and communication with traditional mainframe
software. Building Application Servers is a practical guide to application server technology, explaining the
theory of network computing and providing practical techniques that use these tools to produce effective
business solutions. Rick Leander includes practical examples and program code that use UML, Java, RMI,
and JDBC to illustrate design problems and programming techniques. The development framework offered
spans a variety of platforms, vendors, and middleware architectures. Software developers who are familiar
with traditional client/server technology but want to learn how to move to distributed client/server computing
will find this book invaluable.
